

Making Waves

For well over 2,000 years, traditional Chinese medicine and traditional Indian medicine (ayurveda) have considered energy blockages the cause of pain and disease. And for barely 100 years now, energy medicine in the West has been reaching the same conclusion. Rarely practised in public establishments, it remains relatively unknown here among the general population.

Energy medicine Western-style remains connected to its cultural origins, even though, as with modern medicine, it embraces new technology. While practitioners of Chinese or ayurvedic medicine use their bare hands to perceive their patients' flow of vital energy (chi), health workers (whether German, English or American) who give energy treatments use very sophisticated equipment, such as bioresonance machines.

A question of energy

As with traditional doctors in India or China, those using bioresonance technology in the West believe that there is a direct link between the health of living tissue and the electromagnetic waves that surround it. They believe that all living tissue (plant, animal or human) emits a specific "electromagnetic signature" that varies according to the state of health of the particular tissue involved. This holds true for men, women, bacteria, yeasts, vitamins, mineral salts, and so on, regardless of the dimensions of the person or object being observed.

The goal of bioresonance technology is to identify and nullify "bad" electromagnetic waves by emitting appropriate "good" waves. With bioresonance one can pick up electromagnetic signals emitted by live matter, analyze and measure them, and then generate a wave that can unite with waves of the same frequency to eliminate pathogenic conditions or to promote normal, healthy conditions. The goal is to reestablish a good balance by replacing disharmonious waves with harmonious ones. One of the numerous benefits of bioresonance is the reduction of stress, which is often provoked by modern

life's "electro-smog" (caused by computer screens, cellular telephones, televisions, microwaves, etc.). Bioresonance also helps to rebalance the energy field by eliminating certain irritants and toxins, such as parasites, bacteria and other organisms that invade the body and overload one's system. Once the stress caused by these irritants is neutralized, the body takes over and heals itself.

Bioresonance equipment is considered medical equipment in certain European countries, while in North America it has played a relatively limited role in medicine. Until recently, these machines have mostly been used to obtain real-time patient data or to screen patient reaction to harmful substances or organisms.

For the past five years, however, bioresonance machines have been enjoying a boom in spa settings. Some massage therapists offer bioresonance before a massage in order to make the treatment more efficient and thorough. Estheticians are also offering this service in combination with body and skincare treatments for added value. This service can bring in additional revenue of \$60 to \$150 per client.

Methodology

Bioresonance performs the following functions:

1. It picks up the level of skin conductivity at a specific point on the body and at a specific moment. The targeted points are well-known acupuncture points, or points discovered by researchers through exploration.

2. It picks up variations in the skin's conductivity caused by harmful substances or microorganisms. Through a specific device (electrode, diode, laser, etc.), the "bioenergetic signature" of these substances or microorganisms can be transmitted to the client.

3. It picks up, from several established points, the client's skin conductivity, and transmits, by means of a specific device (electrode, diode, laser, etc.), waves that destroy parasites or bacteria that the client is harbouring.

But beware: certain wave lengths will have negative effects on some clients, beneficial effects on others, and will be neutral for the rest. This is where one's specific predispositions come into play: not everyone will react the same way to certain substances. Bioresonance machines are meant to be adapted to individuals, one by one, and one at a time. They can't function like radio or television stations, nor can they serve as general "irrigation systems," showering everyone in their path with beneficial energy.

You can't fool the waves

The success of bioresonance will depend on:

- 1) the identification of harmful waves for a particular individual
- 2) the transmission of waves that will prove beneficial to the individual
- 3) changes in lifestyle for the individual undergoing treatment

Who in North America really wants to change their lifestyle? Only those whose lives are already seriously threatened. For most of us, an ideal change is one that allows us to change the state we're in without changing the factors that got us into that state in the first place. With energy medicine, we can no longer get away with this kind of attitude. The waves don't lie and we can't cheat the waves. As Richard Feynman, Nobel prizewinner for physics, once said, "Nature cannot be fooled."

We must realize, however, that bioresonance equipment is not a "cure-all." It may produce waves that allow individuals to rid themselves of the substances or organisms that caused their symptoms; however, if these individuals don't change their eating habits or their work and home environment, they risk being quickly reinfected. For this reason, electromagnetic treatments should be combined with a body-detoxification program. And detoxification should always be followed by changes in lifestyle in order to eliminate contact with bacteria, yeasts, germs and other dangerous substances.
